Groundbreaking Biological Protection for Homeland Security & First Responders

March 29-31, Homeland Security Symposium and Expo; Hyatt Regency Crystal City, VA – Responding to a critical need, Premier Micronutrient Corporation's (PMC) scientific leaders have developed a groundbreaking micronutrient antioxidant supplement that decreases oxidative damage caused by hazardous environmental exposures while increasing immune function. The story is unique and based solely on scientific results.

These micronutrients are the result of the work of one of the country's top antioxidant scientists, Dr. Kedar Prasad. They are a unique combination of dietary and endogenous antioxidants present in appropriate forms and ratios to be administered at the proper schedule. In a randomized study in a heavy smoking and meat consuming population showed definitive reduction in oxidative damage and boosting of immune function.

Dr. Gerald Haase, Chief Medical Officer, has said "I'd rather you take nothing at all than something substandard and harmful like many over-the-counter supplements."

Current research includes oxidative and immune studies with the U.S. Navy and Marine Corps for micronutrient use in training and in combat. PMC is assessing radiation protection in collaboration with NASA. The Veterans Administration is evaluating the PMC formulation in diabetic patients and in the heart disease and stroke prevention program with one of the NFL's retired football players associations. Studies continue in the Premier Micronutrient Antioxidant Research Institute in Novato, CA.

Premier Micronutrient Corporation, along with Dr. Prasad and Dr. Haase, will be exhibiting at the inaugural NDIA Homeland Security Symposium and Expo March 29 – 31 at the Hyatt Regency Crystal City, Arlington, VA.
